

This indicates where the arc meets the straight line at a zoom of 2,500%.

As you can see the arc and line do not meet (in fact if anything they overlap!).

The round cornered rectangle was created in Bricscad as a filleted rectangle, so it would originally have all 8 entities touching end to end. When the Rectangle was exported as a PDF the "enable simple geometry optimization" was ticked, so by rights they should still be connected.
